1 Common

1 Setup

1. Terminal: font Monospace 12
2. Gedit: Oblivion, font Monospace 12, auto indent, display line numbers, tab 4, highlight matching brackets, highlight current line, F9 (side panel)
3. /.bashrc: export CXXFLAGS='-Wall -Wshadow -Wextra -Wconversion -Wno-unused-result -Wno-deprecated-declarations -O2 -std=gnu++11 -g -DLOCAL'
4. `for i in {A..K}; do mkdir $i; cp main.cpp $i/$i.cpp; done`

2 Template

```cpp
#include <bits/stdc++.h>

using namespace std;

#define pb push_back
#define mp make_pair
#define fst first
#define snd second
#define sz(x) (int) ((x).size())
#define forn(i, n) for (int i = 0; i < (n); ++i)
#define fornr(i, n) for (int i = (n) - 1; i >= 0; --i)
#define forab(i, a, b) for (int i = (a); i < (b); ++i)
#define all(c) (c).begin(), (c).end()

using ll = long long;
using vi = vector<int>;
using pii = pair<int, int>;

#define FNAME ""

int main() {
#ifdef LOCAL
  freopen(FNAME".in", "r", stdin);
  freopen(FNAME".out", "w", stdout);
#endif
  cin.tie(0);
  ios_base::sync_with_stdio(0);

  return 0;
}
```

3 Stress

```
@echo off

for /L %%i in (1,1,10000000) do (
gen.exe || exit
main.exe || exit
stupid.exe || exit
fc .out 2.out || exit
echo Test %%i OK
)
```

4 Java

```java
import java.io.BufferedReader;

  writeChar('0' + t);
}
```

12 Notes

72 Работа с деревьями

Приемы для работы с деревьями:

1. Двоичные подъемы
2. Поддеревья как отрезки Эйлерова обхода
3. Вертикальные пути в Эйлеровом обходе (на ребрах вниз $+k$, на ребрах вверх $-k$).
4. Храним в вершине значение функции на пути от корня до нее, дальше LCA.
5. Спуск с DFS, поддерживаем ДО на пути до текущей вершины.
6. Heavy-light decomposition
7. Centroid decomposition
8. Корневая по запросам
9. Тяжелые/легкие вершины
10. DFS $\rightarrow$ дерево блоков, размеры $\in [K..2K]$
11. У вершины не более $O(\sqrt{N})$ разных поддеревьев
12. Сумма размеров поддеревьев без тяжелого ребенка $O(n \log n)$
13. Сумма глубин поддеревьев без глубокого ребенка $O(n)$

73 Маски

Считаем динамику по маскам за $O(2^n \cdot n)$ $f[mask] = sum$ по $submask$ $g[submask]$.

$dp[mask][i]$ — значение динамики для маски $mask$, если младшие i бит в ней зафиксированы (то есть мы не можем удалять оттуда).

Ответ в $dp[mask][0]$.

$dp[mask][len] = g[mask]$. Если i-ый бит 0, то $dp[mask][i] = dp[mask][i+1]$, иначе $dp[mask][i] = dp[mask][i+1] + dp[mask \langle 1 << i)][i+1]$.

Старший бит: предподсчет.

Младший бит: $x\& \sim (-x)$

Чтобы по степени двойки получить логарифм, можно воспользоваться тем, что все степени двойки имеют разный остаток по модулю 67.

```
for (int mask = 0; mask < (1 << n); mask++)
^^Isubmask : for (int s = mask; s; s = (s - 1) & mask)
^^Isupmask : for (int s = mask; s < (1 << n); s = (s + 1) | mask)
```

74 Гранди

Теорема Шпрага-Гранди: берем mex всех значений функции Гранди по состояниям, в которые можем перейти из данного.

Если сумма независимых игр, то значение функции Гранди равно xor значений функций Гранди по всем играм.

Бывает полезно вывести первые n значений и поискать закономерность.

Часто сводится к xor по чему-нибудь.

75 Потоки

Потоки:

Name	Asympthotic
Ford-Fulkerson	$O(\|f\| \cdot E)$
Ford-Fulkerson with scaling	$O(\log \|f\| \cdot E^2)$
Edmonds-Karp	$O(V \cdot E^2)$
Dinic	$O(V^2 \cdot E)$
Dinic with scaling	$O(V \cdot E \cdot \log C)$
Dinic on bipartite graph	$O(E\sqrt{V})$
Dinic on unit network	$O(E\sqrt{E})$

L—R потоки:

Есть граф с недостатками или избытками в каждой вершине. Создаем фиктивные исток и сток (из истока все ребра в избытки, из недостатков все ребра в сток).

Теперь пусть у нас есть L-R граф, для каждого ребра e ($v \to u$) известны L_e и R_e. Добавим в v избыток L_e, в u недостаток L_e, а пропускную способность сделаем $R_e - L_e$.

Получили решение задачи о LR-циркуляции.

Если у нас обычный граф с истоком и стоком, то добавляем бесконечное ребро из стока в сток и ищем циркуляцию.

Таким образом нашли удовлетворяющий условиям LR-поток. Если хотим максимальный поток, то на остаточной сети запускаем поиск максимального потока.

В новом графе в прямую сторону пропускная способность равна $R_e - f_e$, в обратную $f_e - L_e$.

MinCostCirculation:

Пока есть цикл отрицательного веса, запускаем алгоритм Карпа и пускаем максимальный поток по найденному циклу.

76 ДП

Табличка с оптимизациями для динамики:

Name	Original recurrence Sufficient Condition	From To
CHT1	$dp[i] = \min_{j<i} dp[j] + b[j] \cdot a[i]$ $b[j] \geqslant b[j+1] \ \|\| \ a[i] \leqslant a[i+1]$	$O(n^2)$ $O(n)$
CHT2	$dp[i][j] = \min_{k<j} dp[i-1][k] + b[k] \cdot a[j]$ $b[k] \geqslant b[k+1] \ \|\| \ a[j] \leqslant a[j+1]$	$O(kn^2)$ $O(kn)$
D&C	$dp[i][j] = \min_{k<j} dp[i-1][k] + c[k][j]$ $p[i,j] \leqslant p[i,j+1]$	$O(kn^2)$ $O(kn \log n)$
Knuth	$dp[i][j] = \min_{i<k<j} dp[i][k] + dp[k][j] + c[i][j]$ $p[i,j-1] \leqslant p[i,j] \leqslant p[i+1,j]$	$O(n^3)$ $O(n^2)$
IOI	$f_n(k)$ — best for fixed k f_n — convex, add penalty $\lambda \cdot k$	$O(k^{(2)}n)$ $O(n \log C)$

77 Комбинаторика

Биномиальные коэффициенты:

Теорема Люка для биномиальных коэффициентов: Хотим посчитать C_n^k, разложим в p-ичной системе счисления, $n = (n_0, n_1, \dots), k = (k_0, k_1, \dots)$. $ans = C_{n_0}^{k_0} \cdot C_{n_1}^{k_1} \cdot \dots$

Способы вычисления C_n^k:

1. $C_n^k = C_{n-1}^k + C_{n-1}^{k-1}$

   precalc: $O(n^2)$, query: $O(1)$.

2. $C_n^k = \frac{n!}{k!(n-k)!}$, предподсчитываем факториалы

   precalc: $O(n \log n)$, query: $O(\log n)$

3. Теорема Люка

   precalc: $O(p \log p)$, query: $O(logp)$.

4. $C_n^k = C_n^{k-1} \cdot \frac{n-k+1}{k}$

5. $C_n^k = \frac{n!}{k!(n-k)!}$, для каждого факториала считаем степень вхождения и остаток

   precalc: $O(p \log p)$, query: $O(logp)$.

$C_n^{\frac{n}{2}} = \frac{2^n}{\sqrt{\frac{\pi n}{2}}}$

80 Разбиения

Число неупорядоченных разбиений n на положительные слагаемые.

$$p(0) = 1,\ p(n) = \sum_{k \in \mathbb{Z} \setminus \{0\}} (-1)^{k+1} p(n - k(3k-1)/2)$$

$$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$$

n	0	1	2	3	4	5	6	7	8	9	20	50	100
$p(n)$	1	1	2	3	5	7	11	15	22	30	627	∼2e5	∼2e8

81 Матричные игры

Пишем матрицу стратегий $A_{i,j}$ это выигрыш первого и проигрыш второго, i стратегия 1-го. Седловая точка есть для несмешанной стратегии если $\max_i \min A_{i,*} = \min_j \max A_{*,j}$. Иначе:

$$f(x) = sum(x_i) \to max, \;\; Ans = 1/f(x)$$

$$Ax \leq 1_n, \;\; x_i \geq 0$$

Для 2×2, p первый игрок, q — второй:

$$p^* = \left(\frac{a_{22} - a_{21}}{a_{22} - a_{12} + a_{11} - a_{21}}; \frac{a_{11} - a_{12}}{a_{22} - a12 + a_{11} - a_{21}} \right)$$

$$q^* = \left(\frac{a_{22} - a_{12}}{a_{22} - a_{12} + a_{11} - a_{21}}; \frac{a_{11} - a_{21}}{a_{22} - a12 + a_{11} - a_{21}} \right)$$

$$Ans = \frac{a_{22}a_{11} - a_{12}a_{21}}{a_{11} + a_{22} - a_{12} - a_{21}}$$

82 Mixed

- Формула Пика: $S = Inside + Edge/2 - 1$
- Теорема Люка: $0 \leq n, m \in \mathbb{Z}$, p простое. $n = n_k p^k + ... + n_1 p + n_0$ и $m = m_k p^k + ... + m_1 p + m_0$. Тогда $\binom{n}{m} \equiv \prod_{i=0}^{k} \binom{n_i}{m_i} \pmod{p}$.
- Лемма Бернсайда: $|X/G|$ число орбит G. $X^g = \{x \in X | gx = x\}$

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|$$
