12 Notes

72 Работа с деревьями

Приемы для работы с деревьями:

- 1. Двоичные подъемы
- 2. Поддеревья как отрезки Эйлера обхода
- 3. Вертикальные пути в Эйлеровом обходе (на ребрах вниз  $+k$ , на ребрах вверх  $-k$ ).
- 4. Храним в вершине значение функции на пути от корня до нее, дальше LCA.
- 5. Спуск с DFS, поддерживаем ДО на пути до текущей вершины.
- 6. Heavy-light decomposition
- 7. Centroid decomposition

73 Маски

Считаем динамику по маскам за  $O(2^n \cdot n)$   $f[mask] = \text{sum по submask } g[submask]$ .  $dp[mask][i]$  — значение динамики для маски  $mask$ , если младшие  $i$  бит в ней зафиксированы (то есть мы не можем удалять оттуда). Ответ в  $dp[mask][0]$ .  $dp[mask][len] = g[mask]$ . Если  $i$ -ый бит 0, то  $dp[mask][i] = dp[mask][i + 1]$ , иначе  $dp[mask][i] = dp[mask][i + 1] + dp[mask \setminus (1 \ll i)][i + 1]$ .

Старший бит: предподсчет.

Младший бит:  $x \& \sim (-x)$

Чтобы по степени двойки получить логарифм, можно воспользоваться тем, что все степени двойки имеют разный остаток по модулю 67.

```
for (int mask = 0; mask < (1 << n); mask++)
  ^^Isubmask : for (int s = mask; s; s = (s - 1) & mask)
  ^^Isupmask : for (int s = mask; s < (1 << n); s = (s + 1) |
    <- mask)
```

74 Гранди

Теорема Шпрага-Гранди: берем тех всех значений функции Гранди по состояниям, в которые можем перейти из данного. Если сумма независимых игр, то значение функции Гранди равно хог значений функций Гранди по всем играм. Бывает полезно вывести первые  $n$  значений и поискать закономерность. Часто сводится к *хот* по чему-нибудь.

75 Потoki

Потоки:

Name	Asympthotic
Ford-Fulkerson	$O( f  \cdot E)$
Ford-Fulkerson with scaling	$O(\log  f  \cdot E^2)$
Edmonds-Karp	$O(V \cdot E^2)$
Dinic	$O(V^2 \cdot E)$
Dinic with scaling	$O(V \cdot E \cdot \log C)$
Dinic on bipartite graph	$O(E\sqrt{V})$
Dinic on unit network	$O(E\sqrt{E})$

L-R потоки: Есть граф с недостатками или избытками в каждой вершине. Создаем фиктивные исток и сток (из истока все ребра в избытки, из недостатков все ребра в сток). Теперь пусть у нас есть L-R граф, для каждого ребра  $e (v \rightarrow u)$  известны  $L_e$  и  $R_e$ . Добавим в  $v$  избыток  $L_e$ , в  $u$  недостаток  $L_e$ , а

пропускную способность сделаем  $R_e - L_e$ . Получили решение задачи о LR-циркуляции. Если у нас обычный граф с истоком и стоком, то добавляем бесконечное ребро из стока в сток и ищем циркуляцию. Таким образом нашли удовлетворяющий условиям LR-поток. Если хотим максимальный поток, то на остаточной сети запускаем поиск максимального потока. В новом графе в прямую сторону пропускная способность равна  $R_e - f_e$ , в обратную  $f_e - L_e$ .

MinCostCirculation: Пока есть цикл отрицательного веса, запускаем алгоритм Карпа и пускаем максимальный поток по найденному циклу.

Биномиальные коэффициенты:

Теорема Люка для биномиальных коэффициентов: Хотим посчитать  $C_n^k$ , разложим в  $p$ -ичной системе счисления,  $n = (n_0, n_1, \dots)$ ,  $k = (k_0, k_1, \dots)$ .  $ans = C_{n_0}^{k_0} \cdot C_{n_1}^{k_1} \cdot \dots$
