74 Работа с деревьями

Приемы для работы с деревьями:

- 1. Двоичные подъемы
- 2. Поддеревья как отрезки Эйлера обхода
- 3. Вертикальные пути в Эйлеровом обходе (на ребрах вниз +k, на ребрах вверх -k).

- 4. Храним в вершине значение функции на пути от корня до нее, дальше LCA.
- 5. Спуск с DFS, поддерживаем ДО на пути до текущей вершины.
- 6. Heavy-light decomposition
- 7. Centroid decomposition
- 8. Корневая по запросам
- 9. Тяжелые/легкие вершины
- 10. DFS → дерево блоков, размеры ∈ [K..2K]
- 11. У вершины не более O(√N) разных поддеревьев
- 12. Сумма размеров поддеревьев без тяжелого ребенка O(n log n)
- 13. Сумма глубин поддеревьев без глубокого ребенка O(n)

75 Маски

Считаем динамику по маскам за  $O(2^n \cdot n)$   $f[mask] = \sum \text{ по } submask$   $g[submask]$ .  
 $dp[mask][i]$  — значение динамики для маски  $mask$ , если младшие  $i$  бит в ней зафиксированы (то есть мы не можем удалять оттуда).  
Ответ в  $dp[mask][0]$ .  
 $dp[mask][len] = g[mask]$ . Если  $i$ -ый бит 0, то  $dp[mask][i] = dp[mask][i + 1]$ , иначе  $dp[mask][i] = dp[mask][i + 1] + dp[mask \setminus 1 \ll i][i + 1]$ .  
Старший бит: предподсчет.  
Младший бит:  $x \& \sim (-x)$   
Чтобы по степени двойки получить логарифм, можно воспользоваться тем, что все степени двойки имеют разный остаток по модулю 67.

```
for (int mask = 0; mask < (1 << n); mask++)
    ^Isubmask : for (int s = mask; s; s = (s - 1) & mask)
    ^Isupmask : for (int s = mask; s < (1 << n); s = (s + 1) | mask)
```

76 Гранди

Теорема Шпрага-Гранди: берем  $\text{mex}$  всех значений функции Гранди по состояниям, в которые можем перейти из данного.  
Если сумма независимых игр, то значение функции Гранди равно хог значений функций Гранди по всем играм.  
Бывает полезно вывести первые  $n$  значений и поискать закономерность.  
Часто сводится к  $xor$  по чему-нибудь.

77 Потоки

Потоки:

Name	Asymphotic
Ford-Fulkerson	$O( f  \cdot E)$
Ford-Fulkerson with scaling	$O(\log  f  \cdot E^2)$
Edmonds-Karp	$O(V \cdot E^2)$
Dinic	$O(V^2 \cdot E)$
Dinic with scaling	$O(V \cdot E \cdot \log C)$
Dinic on bipartite graph	$O(E\sqrt{V})$
Dinic on unit network	$O(E\sqrt{E})$

L—R потоки:  
Есть граф с недостатками или избытками в каждой вершине. Создаем фиктивные исток и сток (из истока все ребра в избытки, из недостатков все ребра в сток).  
Теперь пусть у нас есть L-R граф, для каждого ребра  $e$  ( $v \rightarrow u$ ) известны  $L_e$  и  $R_e$ . Добавим в  $v$  избыток  $L_e$ , в  $u$  недостаток  $L_e$ , а пропускную способность сделаем  $R_e - L_e$ .  
Получили решение задачи о LR-циркуляции.  
Если у нас обычный граф с истоком и стоком, то добавляем бесконечное ребро из стока в сток и ищем циркуляцию.  
Таким образом нашли удовлетворяющий условиям LR-поток. Если хотим максимальный поток, то на остаточной сети запускаем поиск максимального потока.  
В новом графе в прямую сторону пропускная способность равна  $R_e - f_e$ , в обратную  $f_e - L_e$ .  
MinCostCirculation:  
Пока есть цикл отрицательного веса, запускаем алгоритм Карпа и пускаем максимальный поток по найденному циклу.

82 Разбиения

Число неупорядоченных разбиений  $n$  на положительные слагаемые.

$p(0) = 1, p(n) = \sum_{k \in \mathbb{Z} \setminus \{0\}} (-1)^{k+1} p(n - k(3k - 1)/2)$

$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$

83 Матричные игры

Пишем матрицу стратегий  $A_{i,j}$  это выигрыш первого и проигрыш второго,  $i$  стратегия 1-го. Седловая точка есть для несмешанной стратегии если  $\max_i \min A_{i,*} = \min_j \max A_{*,j}$ . Иначе:

$f(x) = \text{sum}(x_i) \rightarrow \max, \text{Ans} = 1/f(x)$

$Ax \leq 1_n, \ x_i \geq 0$

Для  $2 \times 2$ ,  $p$  первый игрок,  $q$  — второй:

$p^* = \left( \frac{a_{22} - a_{21}}{a_{22} - a_{12} + a_{11} - a_{21}}; \frac{a_{11} - a_{12}}{a_{22} - a_{12} + a_{11} - a_{21}} \right)$

$q^* = \left( \frac{a_{22} - a_{12}}{a_{22} - a_{12} + a_{11} - a_{21}}; \frac{a_{11} - a_{21}}{a_{22} - a_{12} + a_{11} - a_{21}} \right)$

$Ans = \frac{a_{22}a_{11} - a_{12}a_{21}}{a_{11} + a_{22} - a_{12} - a_{21}}$
